Transplanting

How do we perform transplanting?

- Like **seedling broadcasting**, the planting material for transplanting is seedlings.
- Usually, the seeds are pre-germinated in a **nursery** up to about 12-14 days.
- 12-14 days old seedlings are removed from the nursery and planted in the field.
    - Unlike seedling broadcasting, seedlings are uprooted from the nursery, therefore devoid of any associated mud.
- Planting could be done either manually or mechanically.
- Each seedling/few seedlings per hill is carefully planted in rows.
- The plant density in the field could be easily maintained.
- Seedlings experience transplanting shock, which affects the seedling growth.
- Transplanting could be practiced as rows or in a random manner.
